Vintage Shop

Create a simple vintage item pricing system using code first. Calculate final prices for customers. Each price for an item is determined by the item category, whether it's Clothing R150, Furniture R600, Vinyl Records R200, Collectibles R450, Artwork R800. They offer discounts based on item condition, so an item is in mint condition then no discount, good condition gets 5% off, fair condition gets 15% off, needs restoration gets 30% off, damaged gets 50% off, then should they be a vintage club member they get an additional 10% discount on top the one they already have only if they chose Artwork and Vinyl Records. If they're buying more than 2 items, then a surcharge of R100 per item is taken into account. Should the customer want the items to be delivered then they pay flat R50 fee, plus a 5% extra fee on the flat fee(R50) if they want to the items to be labeled as Very fragile so it's handled with care if they wanted delivery, however, should they be a vintage club member no fees on delivery straight out. Calculate the base cost, discounts, extra fee, delivery fees and final cost.

1) Create the model/class with correct and necessary properties
2) Create ***AppDbContext*** as the database context class
3) **calcBasePrice** - the initial price for the item based on item category
4) **calcDiscount** - the discounts on condition and membership
5) **calcExtra** – the extra cost-based number of items
6) **calcDeliveryFee** – the fee based on delivery and fragility
7) **calcFinal** - the final price for the item after all discounts and fees
8) Code the controller 'Create' action method with proper method calls
